

Abstract of the Disclosure

A display system includes a repairable memory that re-routes data when a defect exists in the memory. A significant bit in the display memory that would otherwise be corrupted by a bad memory cell is re-routed to a least significant bit position in the memory, and the least significant information is discarded. The repairable memory includes a memory device and two repair routers. One repair router is on the input of the memory, and one repair router is on the output of the memory. One or more least significant bits can be sacrificed to preserve more significant bit information.
